Description

This function processes a data frame containing community data and extracts the relevant columns, unnesting the 'data_community' column in the process.

Usage

```
get_community_data(data = NULL)
```

Arguments

data A data frame. Must contain the columns 'dataset_name' and 'data_community'.

Details

The function performs the following steps:

- Validates that the input is a data frame.
- Ensures the presence of the 'dataset_name' and 'data_community' columns.
- Selects the 'dataset_name' and 'data_community' columns.
- Unnests the 'data_community' column.

Value

A data frame with the 'dataset_name' and unnested 'data_community' columns.
