`extract_prediction_climate`

Extract Prediction Climate Values

Description

Extracts CHELSA raster values for one age slice at prediction grid cell coordinates.

Usage

```
extract_prediction_climate(
  data_grid,
  age,
  abiotic_variables,
  x_lim,
  y_lim,
  cache_dir,
  raster_fn = load_chelsa_raster
)
```

Arguments

`data_grid`	Data frame with ‘grid_id‘, ‘coord_long‘, and ‘coord_lat‘ columns.
`age`	Numeric scalar age in years before present.
`abiotic_variables`	Character vector of CHELSA variable names.
`x_lim`	Numeric longitude range used for raster cropping.
`y_lim`	Numeric latitude range used for raster cropping.
`cache_dir`	Character scalar cache directory passed to [load_chelsa_raster()].
`raster_fn`	Raster-loading function. Defaults to [load_chelsa_raster()].

Value

Tibble with grid coordinates, age, and extracted abiotic columns.

Examples

```
## Not run:
extract_prediction_climate(
  data_grid = data_grid,
  age = 0,
  abiotic_variables = c("bio1", "bio12"),
  x_lim = c(-10, 40),
  y_lim = c(35, 70),
  cache_dir = "Data/Temp/chelsa/prediction"
)

## End(Not run)
```
