check_cuda_gpu_runtime	<i>Check CUDA GPU Runtime for sjSDM</i>
------------------------	---

Description

Performs a strict preflight check for GPU-enabled sjSDM workflows. Verifies torch import, CUDA compilation, and CUDA runtime visibility. Does not fall back to CPU mode.

Usage

```
check_cuda_gpu_runtime(fail_on_error = TRUE, verbose = TRUE)
```

Arguments

fail_on_error	Logical. If 'TRUE' (default), the function aborts when a critical GPU requirement is not met.
verbose	Logical. If 'TRUE' (default), progress and diagnostics are printed.

Details

This function is a strict preflight for GPU-only workflows. It uses '.check_torch_cuda_details()' internally to avoid code duplication with 'verify_sjsdm_setup()'.

Value

A named list with diagnostic fields, including success flags, torch version, CUDA version, and GPU names.
