## Description

Converts a coordinate table to a standard tibble with explicit dataset names and coordinate columns.

## Usage

```
normalize_coordinates(data_source = NULL)
```

## Arguments

|             |                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|
| data_source | A data frame with 'coord_long' and 'coord_lat' columns. Dataset names may be stored either in a 'dataset_name' column or in row names. |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|

## Value

A tibble with 'dataset\_name', 'coord\_long', and 'coord\_lat' columns.
