make_leave_one_location_out_assignments
<i>Make Leave-One-Location-Out Assignments</i>

Description

Assigns each complete sampling location to its own held-out fold using the shared cross-validation assignment schema.

Usage

```
make_leave_one_location_out_assignments(data_locations = NULL, repeat_id = 1L)
```

Arguments

`data_locations` Location table returned by [make_cross_validation_location_table()] with 'location_id', 'n_samples', and 'row_indices' columns.

`repeat_id` Single positive integer identifying the assignment repeat. Defaults to '1L'.

Value

Tibble with 'repeat_id', 'fold_id', 'location_id', 'grid_cell_id', 'n_samples', and 'row_indices'. 'grid_cell_id' is 'NA' because spatial-grid stratification is not applicable to leave-one-location-out assignment.

Examples

```
data_locations <-  
  tibble::tibble(  
    location_id = c("core_a", "core_b"),  
    n_samples = c(2L, 1L),  
    row_indices = list(c(1L, 2L), 3L)  
  )  
make_leave_one_location_out_assignments(data_locations)
```
