select_sjsdm_tuning_round_work_items
<i>Select sjSDM Tuning-Round Work Items</i>

Description

Selects the deterministic work items allowed to execute in one staged tuning round. Later rounds require the previous tier-wide survivor decision and fail closed when that evidence is absent or inconsistent.

Usage

```
select_sjsdm_tuning_round_work_items(  
  data_work_items = NULL,  
  data_schedule = NULL,  
  round_id = NULL,  
  data_prior_decisions = NULL  
)
```

Arguments

data_work_items	Work-item table returned by [build_sjsdm_tuning_work_items()].
data_schedule	Staged schedule returned by [build_sjsdm_tuning_schedule()].
round_id	Positive integer tuning-round identifier to select.
data_prior_decisions	Tier-wide decision table returned by [select_sjsdm_staged_survivors()] for the preceding round. Must be 'NULL' for round one.

Value

Work-item tibble for the configured repeat and tier-wide candidate set, with 'round_id' added as the first column. Existing 'work_item_id' values are preserved so completed fits remain reusable.
