Build Cached Selected sjSDM Folds

Description

Reconstructs the established selected-candidate OOF prediction and diagnostic artifacts from tuning-time probabilities without fitting the selected candidate again.

Usage

```
build_sjsdm_cached_selected_folds(
  data_assignments = NULL,
  data_selected_candidate = NULL,
  data_sample_ids = NULL,
  taxon_names = NULL,
  list_prediction_cache = NULL
)
```

Arguments

`data_assignments`, `data_selected_candidate`, `data_sample_ids`, `taxon_names`	Inputs accepted by [run_sjsdm_selected_candidate_folds()].
`list_prediction_cache`	Fold caches returned by [run_sjsdm_tuning_candidates()] when 'retain_prediction_cache = TRUE'.

Value

Named list with the unchanged 'data_predictions' and 'data_diagnostics' public schemas. Diagnostic fit seeds identify the tuning fits that produced the reused probabilities.

Examples

```
## Not run:
build_sjsdm_cached_selected_folds(
  data_assignments = data_assignments,
  data_selected_candidate = data_selected_candidate,
  data_sample_ids = data_sample_ids,
  taxon_names = taxon_names,
```

```
  list_prediction_cache = list_prediction_cache
)

## End(Not run)
```
