Build Common Spatial sjSDM Regularization Artifact

Description

Selects one candidate from normalized tuning losses using equal source-ID weighting within each spatial tier and equal weighting across tiers.

Usage

```
build_sjsdm_common_regularization_artifact(
  data_tuning_summary = NULL,
  created_at = NULL
)
```

Arguments

`data_tuning_summary`	Repeat-level tuning summaries spanning compatible spatial tiers.
`created_at`	Single POSIX date-time supplied by the orchestration layer.

Details

Taxonomic resolution, response family, candidate hash, candidate IDs, and candidate parameters must be compatible. Predictor structures may differ across tiers and are retained explicitly in the artifact.

Value

Named list containing a one-row artifact, tier_candidate_loss, and candidate_aggregation tibbles.

Examples

```
## Not run:
build_sjsdm_common_regularization_artifact(
  data_tuning_summary = data_tuning_summary,
  created_at = base::Sys.time()
)
```

```
## End(Not run)
```
