Build sjSDM Tier Tuning Artifacts

Description

Splits collected tuning summaries by compatible model context and builds one tier-level selected-regularization artifact per context.

Usage

```
build_sjsdm_tier_tuning_artifacts(
  data_tuning_summary = NULL,
  created_at = NULL,
  include_sample_weighted = TRUE
)
```

Arguments

`data_tuning_summary`	Bound unit tuning summaries accepted by [aggregate_sjsdm_tuning_by_tier()].
`created_at`	Single finite POSIX date-time recorded in every artifact.
`include_sample_weighted`	Logical passed to [build_sjsdm_tier_tuning_artifact()].

Value

Named list of bound artifact, source-loss, candidate-aggregation, and selection-sensitivity tibbles.

Examples

```
## Not run:
build_sjsdm_tier_tuning_artifacts(
  data_tuning_summary = data_tuning_summary,
  created_at = base::Sys.time()
)

## End(Not run)
```
