Compute the Exact Spatial MEM Basis Engine Result

Description

Internal exact-strategy helper for [compute_spatial_mev_basis()].

Usage

```
.compute_exact_spatial_mev_basis(mat_coords, exact_function)
```

Arguments

`mat_coords`	Numeric projected-coordinate matrix.
`exact_function`	Exact Moran-eigenvector construction function.

Details

'sjSDM::generateSpatialEV()' drops matrix dimensions when exactly one positive eigenvector is available and then errors while naming columns. This helper verifies that error against the same calculation with preserved dimensions. The zero-column naming error is classified as spatial data infeasibility only when that calculation confirms no positive eigenvectors.

Value

Named list containing the complete MEV matrix, empty fast-basis state, engine method, and projection method.
