Compute the Fast Spatial MEM Basis Engine Result

Description

Fixed-seed Nyström-strategy implementation for [compute_spatial_mev_basis()].

Usage

```
compute_fast_spatial_mev_basis(
  mat_coords,
  fast_eigenvectors,
  fast_seed,
  fast_function = NULL
)
```

Arguments

`mat_coords`	Numeric projected-coordinate matrix.
`fast_eigenvectors`	Positive integer controlling the low-rank basis.
`fast_seed`	Positive integer used locally for knot selection.
`fast_function`	Fast Moran-eigenvector construction function.

Value

Named list containing the complete MEV matrix, fast projection state, engine method, and projection method.
