Compute One Fold of Predictive Decomposition Shares

Description

Converts full and reduced model values into the established loss or higher-is-better metric share schema.

Usage

```
compute_predictive_fold_shares(
  data_fold,
  value_column,
  direction = base::c("lower", "higher"),
  metric_name = value_column
)
```

Arguments

`data_fold`	One repeat-fold data frame containing full and reduced variants.
`value_column`	Name of the loss or performance column.
`direction`	Either '"lower"' for loss or '"higher"' for performance.
`metric_name`	Output metric label used when 'direction = "higher"'.

Value

A three-row tibble containing component shares for one fold.
