# Compute Predictive Performance Decomposition Shares

## Description

Converts full and reduced higher-is-better predictive metrics into fold-level decomposition shares.

## Usage

```
compute_predictive_performance_shares(
  data_fold_metrics,
  metric_column,
  metric_name = metric_column
)
```

## Arguments

| | |
|---|---|
| `data_fold_metrics` | Data frame with columns 'repeat_id', 'fold_id', 'variant', and the metric named by 'metric_column'. A 'status' column is optional; when present, only rows with status '"ok"' are used. |
| `metric_column` | Single character string. Name of the higher-is-better metric column. |
| `metric_name` | Single character string used in the output. Defaults to 'metric_column'. |

## Value

A tibble with one row per repeat, fold, and component.
