Compute an sjSDM Artifact Content Hash

Description

Computes the stable xxHash64 identity of one v2 artifact while excluding materialization and migration-trace provenance.

Usage

```
compute_sjsdm_artifact_content_hash(
  schema_version = NULL,
  artifact_type = NULL,
  payload = NULL,
  provenance = NULL
)
```

Arguments

`schema_version`	Non-empty character scalar schema version.
`artifact_type`	Registered non-empty character scalar artifact type.
`payload`	Non-empty named list containing the artifact payload.
`provenance`	One-row provenance data frame containing the common provenance fields.

Value

Character scalar xxHash64 content digest.

Examples

```
compute_sjsdm_artifact_content_hash(
  schema_version = "2.0.0",
  artifact_type = "sjsdm_cv_predictions",
  payload = list(data_predictions = tibble::tibble()),
```

```
  provenance = tibble::tibble(
    created_at = as.POSIXct("2026-08-11", tz = "UTC"),
    pipeline_id = "pipeline_paleo_core",
    configuration_profile = "project_cz_paleo",
    source_schema_version = "2.0.0",
    migration_applied = FALSE,
    migration_function = NA_character_
  )
)
```
