Compute Spatial MEM Subspace Similarity

Description

Computes sign- and rotation-invariant similarity between two spatial MEM bases using canonical correlations and principal angles.

Usage

```
compute_spatial_mev_subspace_similarity(data_mev_reference, data_mev_candidate)
```

Arguments

`data_mev_reference`, `data_mev_candidate` Numeric data frames or matrices with aligned rows.

Value

One-row tibble containing aligned row count, compared dimension, canonical correlation summaries, and the largest principal angle in degrees.
