Evaluate Binary AUC

Description

Calculates area under the receiver operating characteristic curve from binary observations and predicted probabilities using average ranks.

Usage

```
evaluate_binary_auc(observed = NULL, predicted_probability = NULL)
```

Arguments

`observed`	Numeric binary observation vector.
`predicted_probability`	Numeric predicted-probability vector aligned with 'observed'.

Value

One-row tibble containing 'auc', 'metric_status', observation counts, and prevalence. AUC is 'NA' when either response class is absent.

Examples

```
evaluate_binary_auc(
  observed = c(0, 0, 1, 1),
  predicted_probability = c(0.1, 0.3, 0.6, 0.8)
)
```
