# Evaluate One sjSDM Fold Prediction Source

## Description

Computes the registered binary metrics for one model or prevalence-null probability vector, including typed incomplete rows.

## Usage

```
evaluate_sjsdm_prediction_source_metrics(
  vec_observed = NULL,
  vec_probability = NULL,
  prediction_source = NULL,
  flag_complete = NULL,
  incomplete_status = NULL,
  epsilon = 1e-06
)
```

## Arguments

| | |
|---|---|
| `vec_observed`, `vec_probability` | Binary observations and aligned probabilities. |
| `prediction_source` | Source identifier stored in every metric row. |
| `flag_complete` | Logical indicating whether probabilities are complete. |
| `incomplete_status` | Status used for typed incomplete metric rows. |
| `epsilon` | Probability clipping tolerance for log loss and calibration. |

## Value

Six-row source-metric tibble.
