Evaluate Tjur R-Squared

Description

Calculates Tjur's coefficient of discrimination from binary observations and predicted probabilities.

Usage

```
evaluate_tjur_r2(observed = NULL, predicted_probability = NULL)
```

Arguments

`observed`	Numeric binary observation vector.
`predicted_probability`	Numeric predicted-probability vector aligned with 'observed'.

Value

One-row tibble containing 'tjur_r2', 'metric_status', observation counts, and prevalence. Tjur R-squared is 'NA' when either response class is absent. Negative values are retained.

Examples

```
evaluate_tjur_r2(

  observed = c(0, 0, 1, 1),

  predicted_probability = c(0.1, 0.3, 0.6, 0.8)

)
```
