Filter Community by Minimum Proportion

Description

Retains community records whose value meets a minimum proportion threshold.

Usage

```
filter_community_by_minimum_proportion(
  data_community = NULL,
  minimum_proportion = 0.01
)
```

Arguments

`data_community`	A data frame containing taxon abundance data. Must include a column named 'value' with numeric proportions or abundances.
`minimum_proportion`	Numeric value between 0 and 1 specifying the minimum proportion threshold for retaining taxa. Default is 0.01 (one percent).

Details

The function validates that 'minimum_proportion' is a numeric value between 0 and 1. After filtering, it checks that at least one taxon remains in the dataset. If no taxa meet the threshold, an error is raised suggesting the threshold may be too high.

Value

A filtered data frame containing only taxa that meet or exceed the minimum proportion threshold. Preserves all original columns.
