Filter Complete Trait Records

Description

Selects the required columns from a raw trait data frame and removes rows where 'taxon_id' is 'NA' or 'trait_value' is not finite.

Usage

```
filter_complete_trait_records(data_trait_records_raw)
```

Arguments

`data_trait_records_raw`	A data frame returned by [load_trait_records_from_vegvault()]. Expected to contain at least 'taxon_id', 'trait_domain_name', and 'trait_value'. Source identifiers are retained when present.

Details

Uses [dplyr::any_of()] for column selection so the function tolerates input data frames that already lack one of the optional columns without error.

Value

A tibble retaining 'dataset_id', 'dataset_name', 'data_source_id', 'sample_id', 'trait_id', 'taxon_id', and the trait fields when present, with incomplete taxon identifiers and non-finite values removed.
