Join Sample Ages

Description

Joins sample ages to records using dataset and sample identifiers.

Usage

```
join_sample_ages(data_records = NULL, data_sample_ages = NULL)
```

Arguments

`data_records`	A data frame containing 'dataset_name' and 'sample_name'.
`data_sample_ages`	A data frame containing 'dataset_name', 'sample_name', and 'age'.

Details

The age table must have at most one row per dataset-sample key. Unmatched records are retained with a missing age.

Value

'data_records' with the matching 'age' column joined.

Examples

```
data_records <-
  tibble::tibble(
    dataset_name = "example",
    sample_name = "sample_1",
    value = 10
  )
data_sample_ages <-
  tibble::tibble(
    dataset_name = "example",
    sample_name = "sample_1",
```

```
    age = 100
  )

join_sample_ages(
  data_records = data_records,
  data_sample_ages = data_sample_ages
)
```
