Load the Prior Local Prepared-Fold Object

Description

Reads the prior local object without consulting target metadata during target execution. Missing, unreadable or non-list objects return NULL. Analytical cache eligibility remains owned by [prepare_sjsdm_tuning_folds()], which reconstructs current inputs first.

Usage

```
load_sjsdm_prepared_fold_cache(

  file_cache = targets::tar_path_target(store = targets::tar_path_store()),

  read_cache_function = qs2::qs_read

)
```

Arguments

`file_cache`	Local object path. The default uses the documented current-target path with the running store; outside target execution it resolves to NA.
`read_cache_function`	Injectable file reader accepting a named file argument. Defaults to the project's qs2 reader, compatible with its current local qs target objects.

Value

The prior list object or NULL. No target metadata are changed.

Examples

```
load_sjsdm_prepared_fold_cache(file_cache = "missing-fold-cache.qs")
```
