Read sjSDM Tier Survivor Decisions

Description

Reads one round's survivor decisions from the isolated tier-tuning store and selects the rows matching one unit model context. Missing, malformed, or ambiguous evidence aborts so unit pipelines cannot prune locally.

Usage

```
load_sjsdm_tier_survivor_decisions(
  store_path = NULL,
  data_model_context = NULL,
  round_id = NULL,
  read_target_function = targets::tar_read_raw
)
```

Arguments

`store_path`	Character scalar path to the dedicated tier-tuning targets store.
`data_model_context`	One-row model-context table.
`round_id`	Positive integer identifier of the completed tier tuning round.
`read_target_function`	Injectable target reader. Defaults to [targets::tar_read_raw()].

Value

Tier-wide decision tibble for the requested model context and round.
