Prepare Binary Prediction Metric Input

Description

Validates aligned binary observations and predicted probabilities and computes counts shared by predictive metric evaluators.

Usage

```
prepare_binary_prediction_metric_input(
  observed = NULL,
  predicted_probability = NULL
)
```

Arguments

`observed`	Numeric vector containing only zero and one.
`predicted_probability`	Numeric vector of predicted probabilities in the closed interval '[0, 1]', aligned one-to-one with 'observed'.

Value

Named list containing validated observation and probability vectors, observation counts, prevalence, and 'class_status'. The status is '"ok"', '"undefined_no_presences"', or '"undefined_no_absences"'.

Examples

```
prepare_binary_prediction_metric_input(
  observed = c(0, 1),
  predicted_probability = c(0.2, 0.8)
)
```
