Prepare an Ordered Fold Partition

Description

Filters a data frame to requested fold identifiers and restores the exact deterministic identifier order. Missing-value handling remains caller-owned.

Usage

```
prepare_ordered_fold_partition(
  data_partition_source = NULL,
  partition_ids = NULL,
  id_column = NULL
)
```

Arguments

`data_partition_source`	Data frame containing the complete sample universe.
`partition_ids`	Unique ordered identifiers requested for one fold partition.
`id_column`	Character scalar naming the identifier column.

Value

Filtered data frame in 'partition_ids' order with source columns unchanged.

Examples

```
prepare_ordered_fold_partition(
  data_partition_source = tibble::tibble(
    sample_id = base::c("b", "a"),
    value = 1:2
  ),
  partition_ids = base::c("a", "b"),
  id_column = "sample_id"
```

)
