Prepare Trait Matrix for Dissimilarity

Description

Applies an explicit named transformation contract to numeric trait columns while preserving the taxon identifier and missing values. Traits omitted from the contract are excluded from the returned sensitivity matrix.

Usage

```
prepare_trait_matrix_for_dissimilarity(
  data_trait_table,
  vec_trait_transformations,
  taxon_column = "taxon_name"
)
```

Arguments

`data_trait_table`	Wide taxon-by-trait data frame.
`vec_trait_transformations`	Named character vector selecting one or more available trait columns. Supported values are "'identity"' and "'log10"'.
`taxon_column`	Character scalar naming the taxon identifier column.

Value

A transformed tibble containing the taxon and selected traits.

Examples

```
prepare_trait_matrix_for_dissimilarity(
  data_trait_table = tibble::tibble(
    taxon_name = c("A", "B"),
    `Plant heigh` = c(10, 100)
  ),
  vec_trait_transformations = c(`Plant heigh` = "log10")
```

)
