Get Continent ID from Scale ID

Description

Resolves the continental parent identifier for a spatial ‘scale_id' using the project’s spatial grid CSV catalogue.

Usage

```
resolve_continent_ids_from_scale_ids(
  scale_id,
  file = here::here("Data/Input/spatial_grid.csv")
)
```

Arguments

`scale_id`	A non-empty character vector identifying spatial units whose 'continent_id' values should be returned.
`file`	Path to the spatial grid CSV catalogue file. Default: 'here::here("Data/Input/spatial_grid.csv")'.

Details

The function validates the inputs, reads the spatial grid CSV, finds rows matching 'scale_id', and returns 'continent_id' values. The function errors when the file is not a readable CSV, when required columns are absent, when any requested 'scale_id' is absent or duplicated, or when any matched row has a missing 'continent_id' value.

Value

A character vector containing one 'continent_id' per supplied 'scale_id', in the same order as 'scale_id'.
