Resolve sjSDM Regularization for Final Fit

Description

Resolves unit-CV, tier-pooled, or no-model regularization from feasibility status and compatible selection artifacts.

Usage

```
resolve_sjsdm_regularization_for_fit(
  data_feasibility = NULL,
  data_model_context = NULL,
  data_unit_selection = NULL,
  data_tier_artifact = NULL
)
```

Arguments

`data_feasibility`	One-row feasibility table containing cv_feasibility_status.
`data_model_context`	One-row table containing tier, taxonomic resolution, response family, predictor structure, and candidate-table hash.
`data_unit_selection`	Optional one-row unit-CV candidate selection.
`data_tier_artifact`	Optional one-row tier artifact returned by [build_sjsdm_tier_tuning_artifact()].

Value

One-row tibble containing model context, feasibility status, selected candidate parameters, regularization source, source tier, and selection status. Full-model-infeasible inputs return explicit missing parameters.

Examples

```
## Not run:
resolve_sjsdm_regularization_for_fit(
  data_feasibility = data_feasibility,
```

```
  data_model_context = data_model_context,
  data_unit_selection = data_unit_selection
)

## End(Not run)
```
