Run Project Configuration Generation

Description

Validates modular configuration sources and materialises tracked artifacts.

Usage

```
run_configuration_generation(
  path_manifest = here::here("Configuration/manifest.yml"),
  path_source_root = here::here(),
  path_destination_root = path_source_root
)
```

Arguments

`path_manifest`	Path to the configuration ordering manifest.
`path_source_root`	Repository root used to resolve manifest fragment and reference paths.
`path_destination_root`	Root under which generated artifact paths are written.

Details

The function validates the complete source set and semantic reference in a temporary directory before writing either destination artifact.

Value

Data frame describing validated profiles and their generated catalog fields.
