Run One Selected sjSDM Fold

Description

Prepares, fits, and predicts one live selected-candidate fold, then delegates all persisted row construction to [build_sjsdm_selected_fold_artifacts()].

Usage

```
run_sjsdm_selected_fold(
  list_fold_context = NULL,
  data_candidate = NULL,
  data_sample_ids = NULL,
  taxon_names = NULL,
  regularization_source = NULL,
  prepare_fold_function = NULL,
  fit_function = NULL,
  predict_function = NULL,
  seed = 900723L
)
```

Arguments

`list_fold_context`	Fold context returned by [build_sjsdm_tuning_fold_context()].
`data_candidate`	One-row selected candidate table without provenance-only fields.
`data_sample_ids`, `taxon_names`	Normalized sample metadata and full ordered response-taxon names.
`regularization_source`	Source label for the selected regularization candidate.
`prepare_fold_function`, `fit_function`, `predict_function`	Injectable selected-fold lifecycle functions.

`seed`	Non-negative base integer used to derive the stable fold fit seed.

Value

Named list with one fold's prediction and diagnostic artifacts.
