Scale Prediction Abiotic Data

Description

Applies training-time scale attributes to abiotic predictor data used for model prediction.

Usage

```
scale_prediction_abiotic(data_climate, scale_attributes)
```

Arguments

`data_climate`	Data frame containing one column for each entry in 'scale_attributes', typically 'age' and selected CHELSA variables.
`scale_attributes`	Named list of scale attributes as returned by [scale_abiotic_for_fit()].

Value

Data frame with the same columns as 'scale_attributes', scaled to the training model scale.

Examples

```
scale_prediction_abiotic(
  data_climate = tibble::tibble(age = 0, bio1 = 8),
  scale_attributes = list(
    age = list("scaled:center" = 0),
    bio1 = list("scaled:center" = 6, "scaled:scale" = 2)
  )
)
```
