Validate Calibration Evidence Against Cached Analytical Inputs

Description

Reconstructs calibration signatures from production folds and structural settings. Legacy results are eligible for migration only on an exact raw input match; acceptance status alone is never sufficient for publication.

Usage

```
validate_sjsdm_cv_calibration_evidence(
  list_result,
  list_prepared_folds,
  config_model_fitting,
  list_legacy_prepared_folds = NULL
)
```

Arguments

`list_result`	Saved calibration result, or 'NULL' when unavailable.
`list_prepared_folds`, `config_model_fitting`	Current production fold records and final fitting configuration.
`list_legacy_prepared_folds`	Optional independently reconstructed original folds for an operational-only version-four migration. Their exact original signature must be reproduced, and their full version-five analytical payload must match current inputs.

Value

A compatibility status, migration status and input fingerprints.

Examples

```
## Not run:
validate_sjsdm_cv_calibration_evidence(result, folds, config_model)

## End(Not run)
```
