.compute_interpolation_on_age_grid
<i>Compute Interpolation on an Age Grid</i>

Description

Computes interpolated values on a regular age grid for one numeric series.

Usage

```
.compute_interpolation_on_age_grid(  
  data_time_series_group,  
  age_variable_name,  
  value_variable_name,  
  interpolation_method,  
  extrapolation_rule,  
  ties_function,  
  age_min,  
  age_max,  
  time_step  
)
```

Arguments

data_time_series_group	A data frame containing one age column and one value column.
age_variable_name	Name of the numeric age column.
value_variable_name	Name of the numeric value column.
interpolation_method	Interpolation method passed to [stats::approx()].

<code>extrapolation_rule</code>	Numeric extrapolation rule passed to <code>[stats::approx()]</code> .
<code>ties_function</code>	Function used by <code>[stats::approx()]</code> to combine tied ages.
<code>age_min</code>	Minimum age in the output grid.
<code>age_max</code>	Maximum age in the output grid.
<code>time_step</code>	Positive spacing between consecutive ages in the output grid.

Value

A tibble containing the interpolated age and value columns.
