prepare_trait_matrix_for_dissimilarity
<i>Prepare Trait Matrix for Dissimilarity</i>

Description

Applies an explicit named transformation contract to numeric trait columns while preserving the taxon identifier and missing values. Traits omitted from the contract are excluded from the returned sensitivity matrix.

Usage

```
prepare_trait_matrix_for_dissimilarity(  
  data_trait_table,  
  vec_trait_transformations,  
  taxon_column = "taxon_name"  
)
```

Arguments

data_trait_table	Wide taxon-by-trait data frame.
vec_trait_transformations	Named character vector selecting one or more available trait columns. Supported values are "identity" and "log10".
taxon_column	Character scalar naming the taxon identifier column.

Value

A transformed tibble containing the taxon and selected traits.

Examples

```
prepare_trait_matrix_for_dissimilarity(  
  data_trait_table = tibble::tibble(  
    taxon_name = c("A", "B"),  
    `Plant heigh` = c(10, 100)  
  ),  
  vec_trait_transformations = c(`Plant heigh` = "log10")  
)
```
