build_community_interpolation_index
<i>Build Community Interpolation Index</i>

Description

Builds small per-dataset branch metadata for paleo community interpolation.

Usage

```
build_community_interpolation_index(data_community = NULL)
```

Arguments

`data_community` A data frame containing a 'dataset_name' column.

Details

Dynamic 'targets' branches should pass these small metadata objects instead of nested community data frames. Worker branches can then filter shared read-only inputs by 'dataset_name'.

Value

A list of branch metadata objects. Each object contains 'dataset_name' and 'flag_empty' elements.

Examples

```
data_community <-  
  tibble::tibble(  
    dataset_name = base::c("core_b", "core_a")  
  )  
  
build_community_interpolation_index(  
  data_community = data_community  
)
```
