## Description

Validates that a prediction matrix or data frame contains finite probability-scale values bounded by zero and one.

## Usage

```
assert_prediction_probabilities(data_predictions, tolerance = 1e-08)
```

## Arguments

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| data_predictions | Numeric matrix or data frame of predicted probabilities.                          |
| tolerance        | Numeric scalar tolerance for small floating-point excursions beyond zero and one. |

## Value

The input 'data\_predictions', unchanged.

## Examples

```
assert_prediction_probabilities(  
  data_predictions = matrix(c(0.1, 0.9), nrow = 1)  
)
```
