check_abiotic_interpolation_contract
<i>Check Abiotic Interpolation Contract</i>

Description

Validates that abiotic interpolation inputs use the deterministic interpolation contract and do not contain age-uncertainty routing artifacts.

Usage

```
check_abiotic_interpolation_contract(  
  data,  
  by = "dataset_name",  
  age_var = "age"  
)
```

Arguments

data	A data frame containing abiotic data to interpolate.
by	A character vector of column names that will be used to group interpolation. Must not include uncertainty iteration columns.
age_var	Name of the age variable column used for interpolation. Must not be 'age_uncertainty'.

Details

Abiotic predictors must use deterministic sample ages. Age uncertainty is restricted to paleo community interpolation through [interpolate_community_data_with_uncertainty()]. This guard fails fast if uncertainty columns or uncertainty-routing arguments reach the abiotic path.

Value

The input 'data', invisibly, when the contract is valid.
