make_community_interpolation_index
Make Community Interpolation Index

Description

Creates small per-dataset branch metadata for paleo community interpolation.

Usage

```
make_community_interpolation_index(data)
```

Arguments

data A data frame containing a 'dataset_name' column.

Details

Dynamic 'targets' branches should pass these small metadata objects instead of nested community data frames. Worker branches can then filter shared read-only inputs by 'dataset_name'.

Value

A list of branch metadata objects. Each object contains 'dataset_name' and 'flag_empty' elements.

Examples

```
data_example <- tibble::tibble(dataset_name = c("core_b", "core_a"))
make_community_interpolation_index(data = data_example)
```
