build_shared_interpolation_data
Build Shared Interpolation Data

Description

Builds a shared-memory interpolation data object using [mori::share()] so local worker processes can read it without each retaining a separate private copy.

Usage

```
build_shared_interpolation_data(data_interpolation = NULL, registry_key = NULL)
```

Arguments

`data_interpolation` A data frame to share across local worker processes.

`registry_key` Optional non-empty key used to retain the shared object in a process-local registry. Reusing a key replaces the previous region.

Details

The returned object must be treated as read-only. Mutating it in a worker can force R to create private copies and remove the memory benefit.

Value

A data frame-like shared-memory object created by [mori::share()].

See Also

[mori::share()]

Examples

```
data_interpolation <-  
  tibble::tibble(dataset_name = "core_a")  
  
data_shared <-  
  build_shared_interpolation_data(  
    data_interpolation = data_interpolation  
  )
```
