extract_community_taxa
Extract Community Taxa

Description

Extracts unique taxon names from in-memory long community data.

Usage

```
extract_community_taxa(data_community = NULL)
```

Arguments

`data_community` A data frame containing a 'taxon' column.

Details

Taxon retain their first-seen order. An empty community aborts because downstream classification and model fitting require at least one taxon.

Value

A character vector of unique taxon names present in the data.

Examples

```
data_community <-  
  tibble::tibble(  
    taxon = base::c("Pinus", "Betula", "Pinus")  
  )  
  
extract_community_taxa(data_community = data_community)
```
