Index 2

load_config_value	<i>Load Named Configuration Value</i>
-------------------	---------------------------------------

Description

Loads one nested value from a named project configuration.

Usage

```
load_config_value(config_id, value, file = here::here("config.yml"))
```

Arguments

config_id	Single non-empty configuration identifier declared in the YAML file.
value	Character vector specifying the nested configuration key path.
file	Path to the generated YAML configuration file.

Details

Use [load_config()] when the complete named configuration is needed. This function is the canonical project boundary around [config::get()] for values from an explicitly named configuration.

Value

The value associated with the requested key path.
