run_sjsdm_cv_calibration_benchmark

Run an Adaptive sjSDM CV Budget Calibration

Description

Executes repeat one rung by rung on cached folds. After each adjacent pair, it runs repeat two at the smaller budget and stops at the first budget that satisfies the registered convergence and stability criteria.

Usage

```
run_sjsdm_cv_calibration_benchmark(  
  data_candidates = NULL,  
  list_prepared_folds = NULL,  
  sel_abiotic_formula = NULL,  
  config_sjsdm_cv_fitting = NULL,  
  data_ladder = build_sjsdm_cv_calibration_ladder(),  
  n_folds_expected = 5L,  
  rung_function = run_sjsdm_cv_calibration_rung,  
  ...  
)
```

Arguments

data_candidates, list_prepared_folds, sel_abiotic_formula
Calibration model inputs.

config_sjsdm_cv_fitting
Validated structural CV fitting configuration.

data_ladder Ordered budget ladder from [build_sjsdm_cv_calibration_ladder()].

n_folds_expected
Required complete fold count. Defaults to five.

`run_function` Injectable rung executor for deterministic orchestration tests.
... Additional arguments passed to `[run_sjsdm_cv_calibration_rung()]`.

Value

Calibration status, accepted budget when available, benchmark evidence, and attempt-level provenance accumulated before stopping.
