validate_trait_corrections	
<i>Validate Trait Manual Corrections File</i>	

Description

Reads the trait manual corrections CSV file and checks that every row has been reviewed by a human. Acts as a pipeline guard: if any row has a 'CHECKED' value that is not 'TRUE' (i.e. is 'NA', 'FALSE', or absent), the function calls 'cli::cli_abort()' listing the number of unchecked rows so the pipeline stops until a human has signed off the file.

Usage

```
validate_trait_corrections(path_corrections)
```

Arguments

`path_corrections`
A character scalar giving the file path to 'trait_manual_corrections.csv'.

Details

The expected CSV columns are: 'taxon_name', 'trait_domain_name', 'action', 'scale_factor', 'notes', 'CHECKED'. The abort message reports exactly how many rows have not been validated and instructs the user to set 'CHECKED = TRUE' after reviewing.

Value

A tibble of validated corrections (all rows have 'CHECKED == TRUE') when every row is approved. Aborts via 'cli::cli_abort()' if any row is not yet validated.
