make_community_interpolation_jobs
<i>Make Community Interpolation Jobs</i>

Description

Splits paleo community and age-uncertainty data into independent per-dataset interpolation jobs for dynamic targets branching.

Usage

```
make_community_interpolation_jobs(data, data_age_uncertainty)
```

Arguments

data	A data frame containing a 'dataset_name' column and community data.
data_age_uncertainty	A data frame containing a 'dataset_name' column and age-model data. Datasets without matching uncertainty rows receive an empty tibble.

Details

Each job is self-contained so a dynamic target branch only retrieves one dataset instead of loading the complete continental inputs.

Value

A list of jobs. Each job contains 'data' and 'data_age_uncertainty' elements for one dataset.
