Apply R Architecture Exceptions

Description

Matches explicit architecture exceptions to current findings and assigns each finding a blocking or excepted resolution status.

Usage

```
apply_r_architecture_exceptions(data_findings, data_exceptions)
```

Arguments

`data_findings`	Data frame with finding type, path, symbol, owner, and message columns.
`data_exceptions`	Data frame using the maintained architecture-exception ledger schema.

Details

Exceptions match on finding type, path, symbol, and owner issue. Duplicate, malformed, or orphaned exceptions are rejected or returned as blocking findings so exceptions cannot silently outlive their owned finding.

Value

A data frame using the maintained architecture-findings schema.

Examples

```
data_findings <-
  tibble::tibble(
    finding_type = "function_naming",
    current_path = "R/Functions/example.R",
    symbol = "example",
    owning_issue = "#1",
    message = "Review the function name."
  )
apply_r_architecture_exceptions(
```

```
  data_findings = data_findings,
  data_exceptions = tibble::tibble(
    exception_id = character(),
    finding_type = character(),
    current_path = character(),
    symbol = character(),
    owner_issue = character(),
    rationale = character(),
    expiry_issue = character()
  )
)
```
