Build Community Interpolation Index

Description

Builds small per-dataset row-range metadata for paleo interpolation.

Usage

```
build_community_interpolation_index(
  data_community = NULL,
  data_age_uncertainty = NULL
)
```

Arguments

`data_community`	A data frame containing a 'dataset_name' column. Rows for each dataset must be contiguous.
`data_age_uncertainty`	A data frame containing a 'dataset_name' column. Rows for each dataset must be contiguous. Datasets without uncertainty rows are supported.

Details

Dynamic 'targets' branches receive constant-size row ranges instead of nested data frames. This avoids scanning the complete shared inputs and allocating a full-table logical mask in every worker branch.

Value

A list of branch metadata objects. Each object contains 'dataset_name', 'flag_empty', and inclusive row ranges for both shared input tables.

Examples

```
data_community <-
  tibble::tibble(
    dataset_name = base::c("core_b", "core_a")
```

```
  )
data_age_uncertainty <-
  tibble::tibble(
    dataset_name = "core_a"
  )

build_community_interpolation_index(
  data_community = data_community,
  data_age_uncertainty = data_age_uncertainty
)
```
