Build a Land Prediction Grid

Description

Creates a regular longitude-latitude prediction grid for one spatial unit, masks it to land, and projects coordinates to a metric CRS.

Usage

```
build_land_prediction_grid(
  scale_id,
  grid_resolution,
  target_crs = 3035L,
  path_spatial_grid = here::here("Data/Input/spatial_grid.csv"),
  land_polygons = NULL
)
```

Arguments

`scale_id`	Character scalar identifying a spatial unit in 'path_spatial_grid'.
`grid_resolution`	Numeric scalar grid resolution in decimal degrees.
`target_crs`	Integer EPSG code used by [project_coords_to_metric()].
`path_spatial_grid`	Path to the spatial grid CSV catalogue.
`land_polygons`	Optional 'sf' polygon object used as the land mask. If 'NULL', Natural Earth country polygons are loaded with 'rnaturalearth'.

Value

Named list with 'data_grid', 'data_grid_coords_projected', 'x_lim', and 'y_lim'.

Examples

```
## Not run:
build_land_prediction_grid(
  scale_id = "europe",
  grid_resolution = 0.5,
  target_crs = 3035L
)

## End(Not run)
```
