Make Leave-One-Location-Out Assignments

Description

Assigns each complete sampling location to its own held-out fold using the shared cross-validation assignment schema.

Usage

```
build_leave_one_location_out_assignments(data_locations = NULL, repeat_id = 1L)
```

Arguments

`data_locations`	Location table returned by [build_cross_validation_location_table()] with 'location_id', 'n_samples', and 'row_indices' columns.
`repeat_id`	Single positive integer identifying the assignment repeat. Defaults to '1L'.

Value

Tibble with 'repeat_id', 'fold_id', 'location_id', 'grid_cell_id', 'n_samples', and 'row_indices'. 'grid_cell_id' is 'NA' because spatial-grid stratification is not applicable to leave-one-location-out assignment.

Examples

```
data_locations <-

  tibble::tibble(

    location_id = c("core_a", "core_b"),

    n_samples = c(2L, 1L),

    row_indices = list(c(1L, 2L), 3L)

  )

build_leave_one_location_out_assignments(data_locations)
```
