Build a Shared Interpolation Descriptor

Description

Shares interpolation data with [mori::share()] and returns a stable descriptor instead of persisting a process-local memory handle.

Usage

```
build_shared_interpolation_data(data_interpolation = NULL, registry_key = NULL)
```

Arguments

`data_interpolation`	A data frame to share across local worker processes.
`registry_key`	Optional non-empty key used to retain the shared object in a process-local registry. Reusing a key replaces the previous region.

Details

The live memory name is written to the store-scoped directory in 'BIODYNAMICS_INTERPOLATION_SHARED_REGISTRY'. Workers must treat the mapped data as read-only.

Value

A list containing 'registry_key' and deterministic 'source_hash'.

See Also

[mori::share()]

Examples

```
data_interpolation <-

  tibble::tibble(dataset_name = "core_a")

data_shared <-

  build_shared_interpolation_data(

    data_interpolation = data_interpolation
```

)
