Build Cumulative sjSDM Tuning Work Items

Description

Expands staged tuning through the first unfinished round while preserving deterministic work-item identities from all completed rounds. A later round is included only when the preceding tier-wide survivor decision is available.

Usage

```
build_sjsdm_cumulative_tuning_work_items(
  data_work_items = NULL,
  data_schedule = NULL,
  list_prior_decisions = base::list()
)
```

Arguments

`data_work_items`	Complete work-item table returned by [build_sjsdm_tuning_work_items()].
`data_schedule`	Staged schedule returned by [build_sjsdm_tuning_schedule()].
`list_prior_decisions`	Ordered list of consecutive tier-wide decision tables, beginning with round one. An empty list authorizes round one only.

Value

Cumulative work-item tibble through the first authorized unfinished round. Existing 'work_item_id' values are preserved for dynamic-branch reuse.
